

Exam - 3

November 17, 2022

Objective

Develop 'ML Model vs Image Filters' app.

Motivation

UIFilters, ML, Images processing.

Must Follow

You must follow the rules below.

1. Start your XCode project "**Exam3_LastName_FirstName**" (replace **LastName** with your last name and **FirstName** with your first name).
 - a. **DON'T DO** the following:
 - i. Start with any other project name and change the zip file name later.
 - ii. This will not be accepted at all.
2. You must have to do the exercise compatible with **XCode version 13.4.1** or **XCode version 14**.

Tips

- **Read the question carefully, then start coding!**
- **Build, Build, and Build**
 - If you add anything on storyboard -> **Build**
 - If you make a reference from storyboard -> **Build**
 - Do not wait until finishing all parts and build.
 - It is easier to debug after each single feature added.

Submission

Zip XCode project and submit to the blackboard. The name of your zip file will be automatically "**Exam3_LastName_FirstName.zip**" (**LastName** is your last name and **FirstName** is your first name). One submission per person.

Details

Create an iOS application using Swift as the programming language. Start your XCode project “**Exam3_LastName_FirstName**” (replace **LastName** with your last name and **FirstName** with your first name).

[2 pts] Design your interface to look like the screenshots [Figure 1 and Figure 5]

- Design your UI for **all iPhone models** in the **Portrait** mode. Disable **Landscape** mode and any screen rotations for all devices.
- Pay attention to images, icons, colors, fonts, and font sizes

Default state: ‘Original’ tab selected. Buttons ‘25%’ and ‘75%’ are disabled. Image analysis performed. [Figure 1 and Figure 6]

Fonts: Title in American Typewriter, 24; System

[2 pts] When the user taps the first button, allow the user to load images from the photo library [Figure 5]. After a new image is selected, show the new image with no filters applied and the ‘Original’ tab selected. Perform and show the results of ML analysis [Figure 6]. Buttons ‘25%’ and ‘75%’ are not available when the ‘Original’ tab is selected.

[4 pts] When the user taps one of the filters, apply the relevant image filtering [Figure 7]. The list of filters is:

‘Blur’ – CIGaussianBlur, radius: 100 (100%)

‘Binarize’ - CIColorThreshold, threshold: 10 (100%)

‘Sepia’ - CiSepiaTone, intensity: 0.5 (100%)

Perform and show the results of ML analysis. Buttons ‘25%’ and ‘75%’ are available for each filter. When the user taps one of those, perform **additive** image filtering, like in these examples:

Starting with the initial ‘Image 0’:

Press Sepia tab -> Sepia, intensity 0.5 applied -> ‘Image 1’ complete with ML analysis

Press 25% -> Sepia, intensity $0.5 \cdot 0.25$ applied to ‘Image 1’ -> ‘Image 2’ with ML analysis

Press 75% -> Sepia, intensity $0.5 \cdot 0.75$ applied to ‘Image 2’ -> ‘Image 3’ with ML analysis

...

[2 pts] When the user presses the ‘Original’ tab, all image transformations are reverted and ML analysis is performed on the initial image, that is, ‘Image 0’ [Figure 1 and Figure 6]

[Bonus points: 2pt.] Replace buttons ‘25%’ and ‘75%’ with a slider [Figure 8]. Range for the slider should be 0 – 300%. Slider filtering is **not additive**. Perform ML analysis after each slider change.

Good luck and happy coding! ☺ Hope you will enjoy.
